SimMom

SimMom is a birthing simulator, representing a full term pregnant adult woman. She responds to clinical intervention, instructor control, and pre-programmed scenarios, and allows for the observation of both maternal and fetal vital signs.

Customizable scenarios and real-time instructor controls allow scenarios to be adapted and developed to your unique learning objectives.

Pre-programmed scenarios developed specifically for SimMom in conjunction with PROMPT and the NLN include normal and operative vaginal deliveries of infants, vaginal delivery with shoulder dystocia encounters and breech infants.
