

Treatment of OUD in Primary Care: Collaborative Care Approach

Charles Brackett, MD, MPH

5/17/19

The Opioid Crisis

72,000 OD deaths in 2017
200/day

**National Vital Statistics System
Mortality File**

3 Waves of the Rise in Opioid Overdose Deaths

Treatment (MAT) Works!

- OAT reduces all cause mortality 70%
- Reduces illicit opioid use
- Reduces other drug use
- Reduces criminal activity
- Improves psycho-social function
- Improves mental health
- Reduces HIV and Hep C
- Reduces ED visits and admissions
- Reduces overall medical costs

Figure 2: Kaplan-Meier curve of cumulative retention in treatment

Treatment Gap

Cascade of Care for Opioid Use Disorder

-Williams AR et al Health Affairs 2017

Barriers to Treatment

- Inadequate recognition
- Inadequate access:
 - Shortage of Addiction Specialists
 - Financial and logistical barriers
 - Leads to missed opportunities
- Challenges navigating complex healthcare systems
- Addiction care is often fragmented from other medical and mental health care
- Stigma/misunderstanding

Reducing Stigma by Understanding Addiction

- Getting high → seeking escape from suffering, feel “normal”
- Willful misbehavior/moral failing → chronic disease
- Criminals to be punished/shamed → Persons in need of help+care
- OAT as “replacing one addiction with another” → highly effective evidence-based standard of care

↓ Treatment Gap by Mainstreaming OUD Treatment into General Medical Care

- Inadequate recognition → Screen for OUD
- Inadequate access:
 - Shortage of Addiction Specialists → Treatment by Generalist Clinicians
 - Financial and logistical barriers → primary care visits, close to home
 - Leads to missed opportunities → capture reachable moments
- Challenges navigating complex healthcare systems → make it simple
- Addiction care is often fragmented from other medical and mental health care → integrate care
- Stigma/misunderstanding → "treat like any other patient"

Medication Assisted Therapy

Full MU Agonist:

Methadone

Partial MU Agonist:

Buprenorphine

Full MU Antagonist:

Naltrexone

- Naltrexone has the highest receptor BINDING AFFINITY, then buprenorphine, then methadone

Intrinsic Activity: Full Agonist (Methadone), Partial Agonist (Buprenorphine), and Antagonist (Naloxone)

Opioid Agonist Therapy (OAT)

Methadone & Buprenorphine

Methadone Maintenance

- “gold standard”
- Reduces use, sociopathy, seroconversion...
- Can't be prescribed for opiate dependence in clinic- need OTP
- Can be dispensed inpt, 3 day rule
- Drawbacks:
 - Weight gain, brain fog, hypogonadism
 - Daily → frequent visits, transportation/availability
 - for-profit clinics, risk by association
 - Stigma

Buprenorphine

- Partial agonist with high binding affinity
- Slow kinetics
- Less reinforcing
- Reduces withdrawal symptoms
- Reduces craving
- Blocks other opiates
- buprenorphine+naloxone (4:1)
 - Generic sublingual pills
 - Suboxone films
 - Bunavail, Zubsolv, Probuphine (6mo implant), Sublocade

Prescribing buprenorphine

- Need a special DEA #
 - DATA 2000: MDs prescribe after 8 hour course
 - CARA 2016: PAs and NPs prescribe after 24 hour course (as of 2/27/17)
 - 30 first year, can then apply to go up to 100
- Schedule III- available in pharmacies
- Can prescribe in outpatient setting- PC, psych
 - Greater access/availability, less stigma
- OK to use in hospital for intercurrent illness and dispense 3d without DEA#

Naltrexone

- Opiate receptor antagonist- Patients must be fully detoxed. Helps craving 2 ways
- Oral: No better than placebo, due to poor adherence
- Can work for patients who are
 - highly motivated or legally mandated to be abstinent
 - in closely supervised settings
 - milder OUD
 - In occupations not permitting OAT: driving, medical...
 - Probation: 70% less opiate use, 50% less reincarceration
 - Medical personnel
- Injectable monthly form: Vivitrol
 - Limited data, low quality studies (Russia, jail)
 - No head to head trials with OAT, until....

Primary Care and the Opioid-Overdose Crisis — Buprenorphine Myths and Realities

Sarah E. Wakeman, M.D., and Michael L. Barnett, M.D.

Myths and Realities of Opioid Use Disorder Treatment.

Myth	Reality	Possible Policy Response
Buprenorphine treatment is more dangerous than other chronic disease management.	Buprenorphine treatment is simpler than many other routine treatments in primary care, such as titrating insulin or starting anticoagulation. But physicians receive little training in it.	Amend federal buprenorphine-treatment eligibility requirements to include training completed during medical school and require training during medical school or residency. Add competency questions to U.S. Medical Licensing Examination and other licensing exams.
Use of buprenorphine is simply a “replacement” addiction.	Addiction is defined as compulsively using a drug despite harm. Taking a prescribed medication to manage a chronic illness does not meet that definition.	Public health campaign to reduce stigma associated with addiction treatment, similar to past campaigns (e.g., HIV) that provided education and challenged common myths.
Detoxification for opioid use disorder is effective.	There are no data showing that detoxification programs are effective at treating opioid use disorder. In fact, these interventions may increase the likelihood of overdose death by eliminating tolerance.	Advocacy from professional physician organizations to educate federal and state agencies and policymakers about evidence-based treatment and the lack of evidence for short-term “detoxification” treatment.
Prescribing buprenorphine is time consuming and burdensome.	Treating patients with buprenorphine can be uniquely rewarding. In-office inductions and intensive behavioral therapy are not required for effective treatment.	Develop and disseminate protocols for primary care settings that emphasize out-of-office induction and treatment.
Reducing opioid prescribing alone will reduce overdose deaths.	Despite decreasing opioid prescribing, overdose mortality has increased. Patients with opioid use disorder may shift to the illicit drug market, where the risk of overdose is higher.	Develop a national system of virtual consultation for physicians to reach addiction and pain specialists who can support treatment of patients with suspected opioid use disorder.

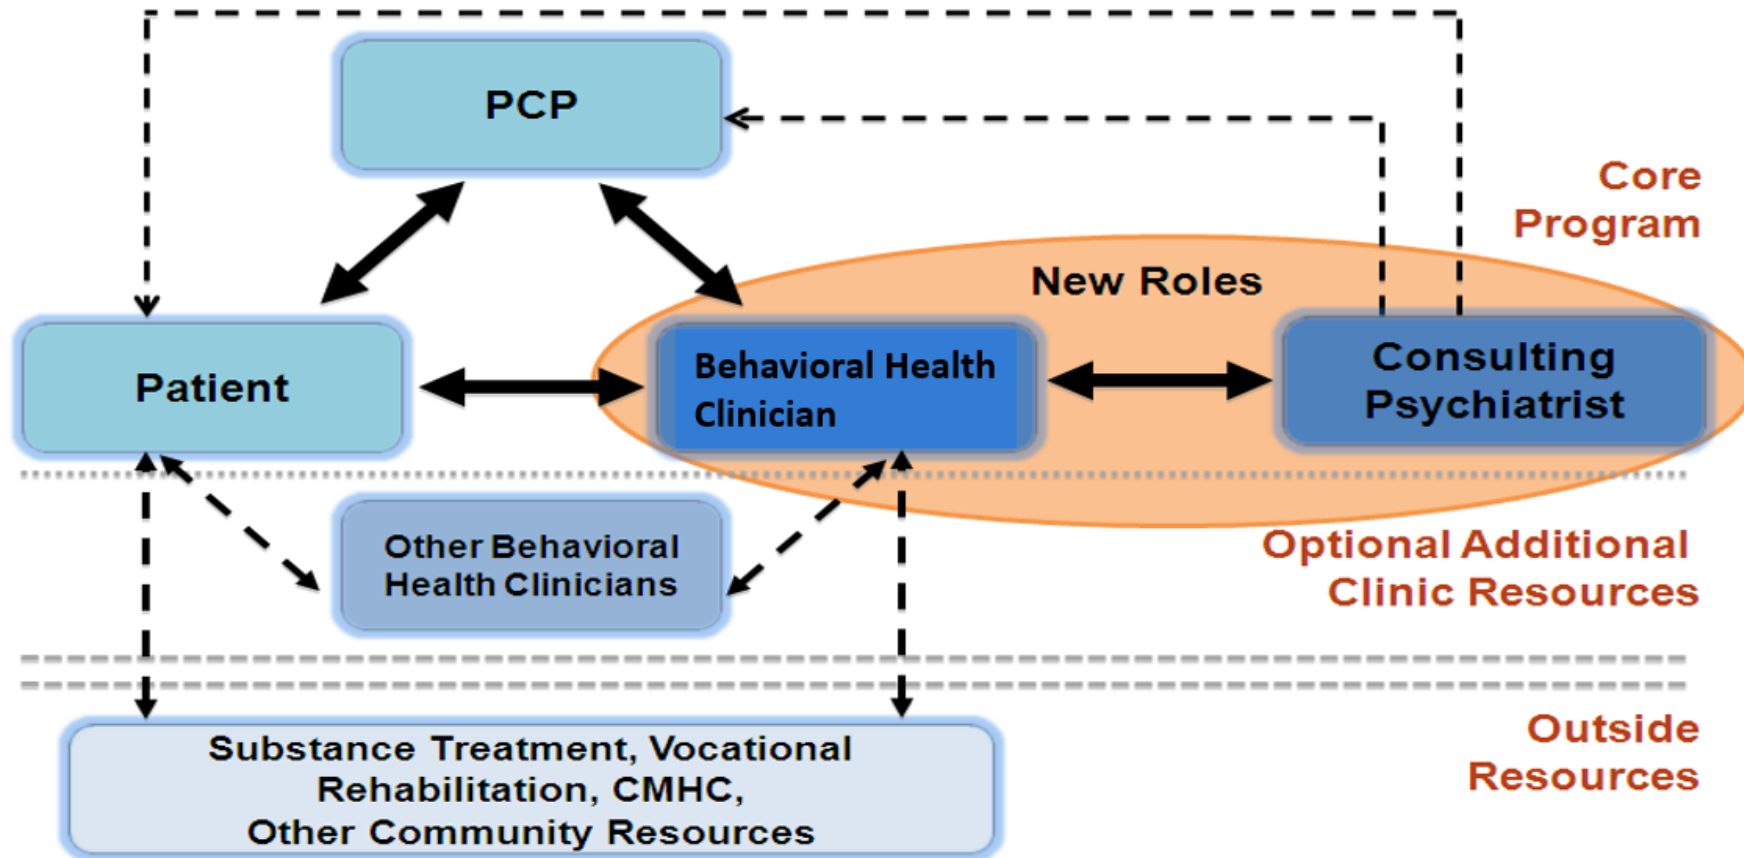

- 
- 4 RCTs comparing primary care based vs specialty care based showed better outcomes with primary care based treatment
 - Treatment retention 86% vs. 67%
 - Opioid abstinence: 67% vs. 35%
 - Patient satisfaction: 77% vs 38%

Primary Care-Based Models for the Treatment of Opioid Use Disorder

—Korhuis et al, Annals 2017

- 12 models of care examined; conclusions:
- Psychosocial services are critical; better if on-site; more extensive counseling may not lead to better outcomes than brief counseling
- Key to success is having a nonphysician “glue person” in the integration/coordination role
- Tiered care, coordinated with specialty addiction treatment services
- Education and outreach important to reduce stigma, increase uptake and # of waived MDs
- The ideal model of care depends on local factors: expertise available, population, proximity to addiction center of excellence, reimbursement policies, geographic factors...

TREATMENT NEEDS QUESTIONNAIRE

Patient Name/ID: _____ Date: _____ Staff Name/ID: _____

Ask patient each question, circle answer for each	Yes	No
Have you ever used a drug intravenously?	2	0
If you have ever been on medication-assisted treatment (e.g. methadone, buprenorphine) before, were you successful? (If never in treatment before, leave answer blank)	0	2
Do you have a chronic pain issue that needs treatment?	2	0
Do you have any significant medical problems (e.g. hepatitis, HIV, diabetes)?	1	0
Do you ever use cocaine, even occasionally?	2	0
Do you ever use benzodiazepines, even occasionally?	2	0
Do you have a problem with alcohol, have you ever been told that you have a problem with alcohol or have you ever gotten a DWI/DUI?	2	0
Do you have any psychiatric problems (e.g. major depression, bipolar, severe anxiety, PTSD, schizophrenia, personality subtype of antisocial, borderline, or sociopathy)?	1	0
Are you currently going to any counseling, AA or NA?	0	1
Are you motivated for treatment?	0	1
Do you have a partner that uses drugs or alcohol?	1	0
Do you have 2 or more close friends or family members who do not use alcohol or drugs?	0	1
Is your housing stable?	0	1
Do you have access to reliable transportation?	0	1
Do you have a reliable phone number?	0	1
Did you receive a high school diploma or equivalent (e.g. did you complete > 12 years of education)?	0	1
Are you employed?	0	1
Do you have any legal issues (e.g. charges pending, probation/parole, etc)?	1	0
Are you currently on probation?	1	0
Have you ever been charged (not necessarily convicted) with drug dealing?	1	0

Totals _____ + _____

Total possible points is 26

Scores 0-5 excellent candidate for office based treatment

Scores 6-10 good candidate for office based treatment with tightly structured program and on site counseling

Scores 11-15 candidate for office based treatment by board certified addiction physician in a tightly structured program or HUB induction with follow up by office based provider or continued HUB status

Scores above 16 candidate for HUB (Opioid Treatment Program-OTP) only

Intake: in-person, team approach

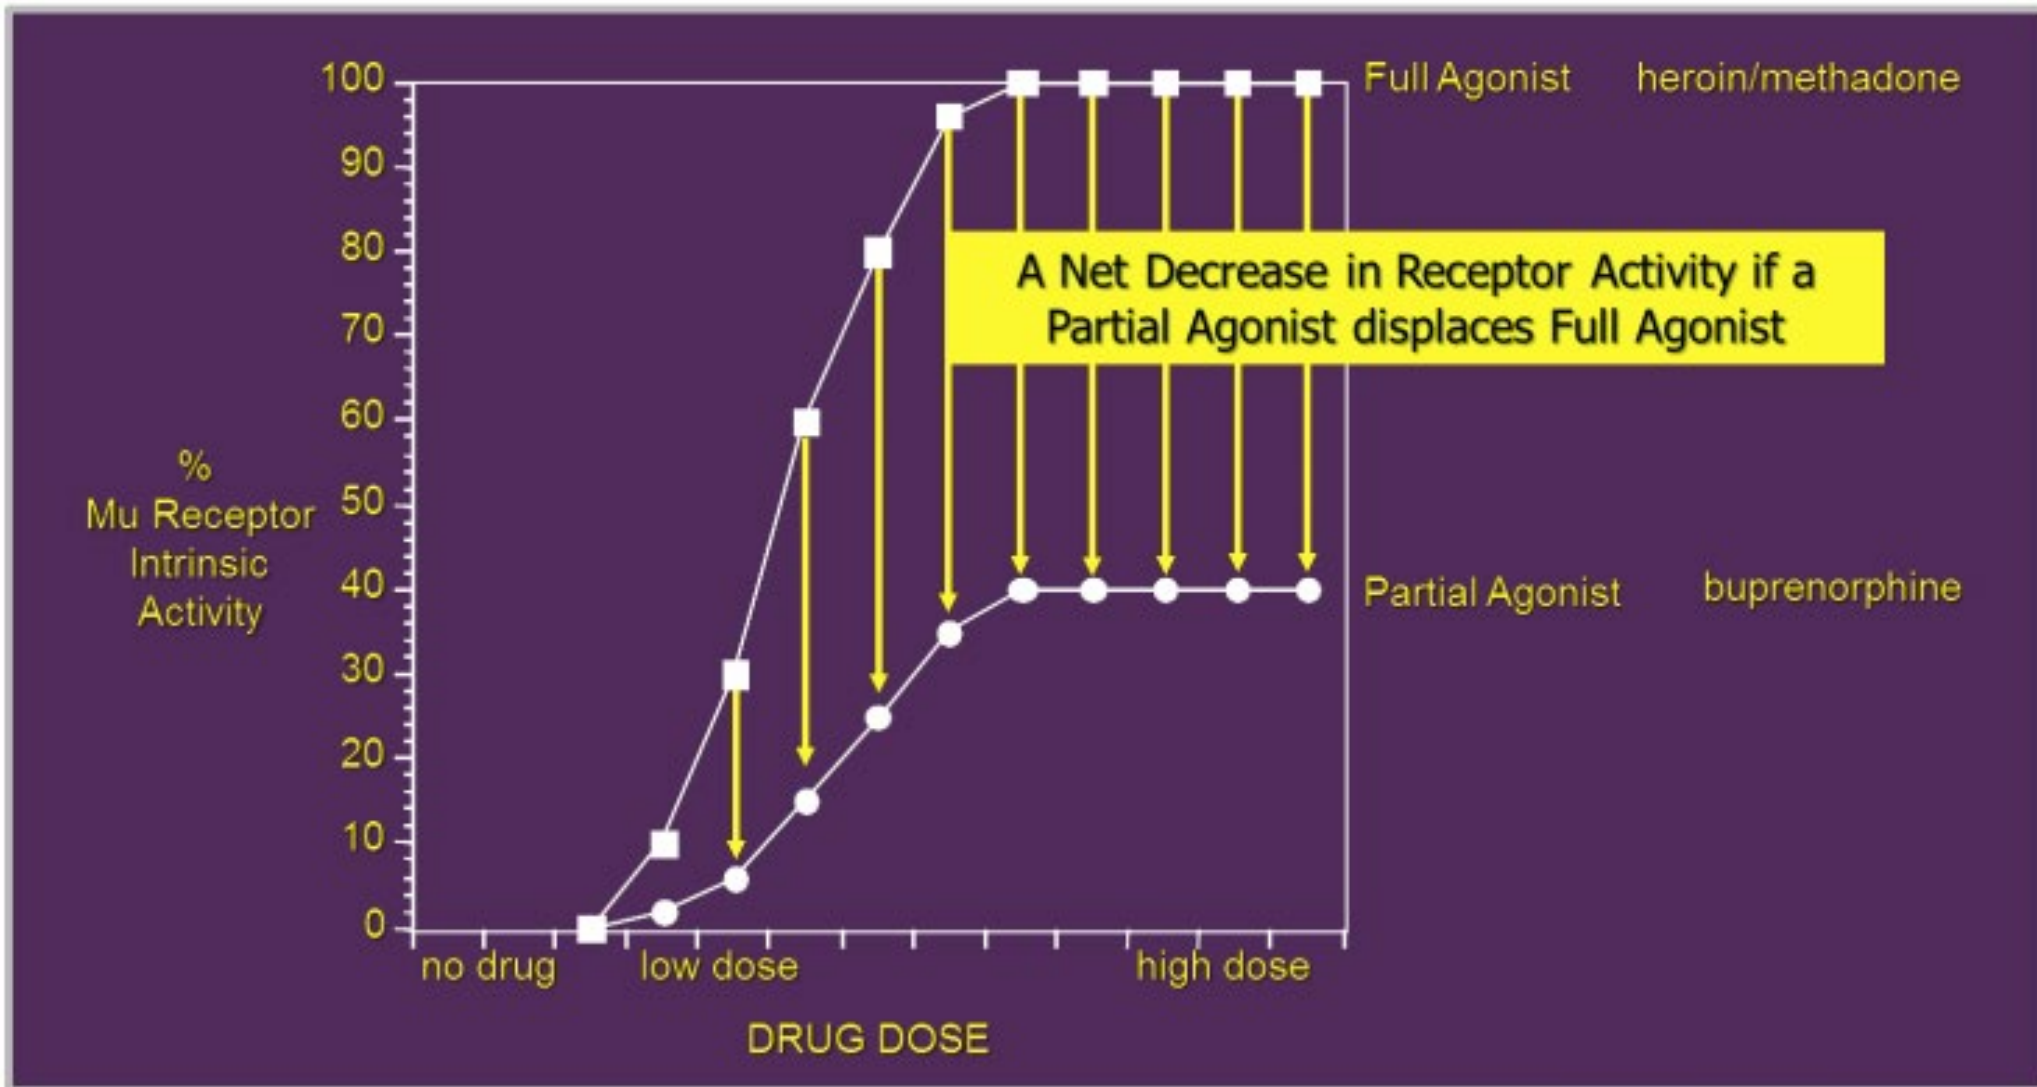

- MA: UDT, Pregnancy test, PDMP, BAM
- BHC:
 - add detail to intake, complete template
 - Addiction history, other illicit, sedatives/etoh
 - Psych co-morbidities
 - Psycho-social circumstances, motivation
 - Education about addiction, treatment options
 - Review rules/expectations: treatment agreement
 - Choose and document single appointed pharmacy
 - Discuss counseling options, negotiate a plan, ROI

Intake...

■ Prescriber:

- Review BHC note, elaborate on issues
- Review medical co-morbidities, medications
- Physical exam and lab testing
- Review consent/Tx agreement- sign
- Assessment and Plan
 - Induction plan
 - Consider naloxone
 - Follow-up (MAT appointment) with BHC, Prescriber

Induction: Precipitated Withdrawal

Induction: where?

- Not needed if on Bup (street or other program)
- Home induction (pt instructions)
- In-office induction
- IOP induction

If you get called...

- Try another dose of buprenorphine
- For recalcitrant symptoms:
 - Acetaminophen/ibuprofen for aches/pains
 - Loperamide for diarrhea/cramps
 - Diphenhydramine or trazodone for insomnia
 - Clonidine 0.1 q 2 hours for severe anxiety/jitters
 - Promethazine 25mg po q 6 for nausea

Follow-up: Stabilization and Maintenance

- Target dose 12-16 mg/day
- Weekly follow-up until “stable”
- MA: UDT, PDMP, BAM
- BHC/prescriber:
 - Assessment of progress and risk of diversion
 - Assess craving, discuss relapse triggers
 - Assess psychiatric symptoms
 - Check in on outside counseling/mutual help
 - Encouragement/Motivational interviewing
 - Promote healthy lifestyle, coping skills (MM)
- Random pill/film counts and UDTs

BUPRENORPHINE INFORMED CONSENT AND TREATMENT AGREEMENT

Buprenorphine is an FDA approved medication for treatment of opioid use disorder (addiction) that is both a stimulator (agonist) and partial blocker of the opioid receptor. The opioid agonist effect reduces withdrawal symptoms and craving, while the blocking effect, at higher doses, prevents or lessens the effect (high) of using another opioid drug. There are other medical treatments for opiate addiction, including methadone and naltrexone. All medications should be used in together with psycho-social treatments, such as counseling, mutual help groups, and self-management apps, websites and books.

Buprenorphine can result in physical dependence similar to other opioids. Withdrawal symptoms are generally less intense than with heroin or methadone, and can be minimized by tapering gradually over several weeks to months. Buprenorphine can cause drowsiness- so you should arrange not to drive until you are accustomed to its effects. Combining buprenorphine with other substances, especially those which can cause sedation such as benzodiazepines (Valium®, Librium®, Ativan®, Xanax®, Klonopin®, etc.) or alcohol, can be dangerous. A number of deaths have

Buprenorphine Smartset

Mitchell Young, MD Chief of Urgent Care, Nashua

Unhealthy Alcohol and Drug Use Adult, Primary Care, Clinical Practice Guideline

Treating pain in pts on bup

- Precipitating relapse by stopping bup
- Tolerance
- Blocking effect of buprenorphine (>95% receptors occupied w/ 16mg/d)
- Emerging consensus to keep buprenorphine going
- Non opioid pain relief preferred: NSAIDs, SNRI, GP, blocks, ketamine
- Raise and split the dose of buprenorphine
- Adding opioids to buprenorphine can add analgesia without euphoria
 - Po oxycodone
 - Fentanyl and hydromorphone (dilaudid) have highest binding capacity

Urine Toxicology Collection

- Supervised, not observed – trauma informed approach
- No personal belongings in bathroom aside from cell phone, wallet
- Trash receptacle kept outside of the bathroom, no flushing toilet until sample is handed to attendant
- Consider adding coloring agent to toilet water
- Do not send suspicious samples for testing
- If concerned: communicate with the patient, obtain repeat sample.
 - Consider checking specific gravity (1.002-1.03) or creatinine (>20mg/dL)
- Oral swabs: more tamper resistant, but generally less reliable compared to urine toxicology.

Screening and Confirmatory Tests

A common clinical approach:

- Test for a panel of commonly-used substances using screening tests
- Then to perform confirmatory tests only for positive results whose accuracy is important for treatment planning
- Confirmatory testing is not necessary in every case

Screening Tests	Confirmatory Tests
<ul style="list-style-type: none">▪ Relatively rapid, inexpensive methods, usually based on immunoassay.▪ Can be performed in a lab, or using kits for onsite point-of-care testing (POCT).▪ Results are considered presumptive until confirmed by a more definitive test.	<ul style="list-style-type: none">▪ Use more expensive, time-consuming methods that combine chromatography and spectrometry.▪ Likely performed in a certified lab – so may take longer to return to Provider▪ More precise and more specific than screening tests, and thus their results are considered definitive.

SAMHSA, 2012

Diversions and Misuse of Buprenorphine

Reasons for Illicit Buprenorphine Use (%)

Adapted from: Schuman-Olivier Z, Albanese M, Nelson SE, et al. Self-treatment: illicit buprenorphine use by opioid-dependent treatment seekers. *J Subst Abuse Treat.* 2010 Jul;39(1):41-50. doi: 10.1016/j.jsat.2009.09.004

Misuse Potential of Buprenorphine

- Abuse potential less than full opioid agonists.
- Euphoria in non-opioid dependent individuals.
- Abuse among opioid-dependent individuals is relatively low.
- Most illicit use is to prevent or treat withdrawal and cravings.

Yokel MA et al. Curr Drug Abuse Rev (2011)
Alho H., et al. Alcohol Dependence (2007)

Signs a Patient May Be Struggling

- Missed appointments
- Requests early refills of buprenorphine or other meds with misuse potential
- Decreased social functioning
- Arriving impaired or inappropriate behavior
- Inappropriate toxicology results
- Tampered urine screens
- Unable to void, or demanding to void immediately
- Calls or reports that the patient is “selling” medication
- Emergency room visits, hospitalizations

Responding to Patient Struggles

- Address behavior with patient
 - Discuss with patient ASAP.
 - Verbalize your concerns.
 - Be supportive.
- Establish new intensified treatment plan:
 - Patient-specific and achievable in your setting.
 - Signed agreements.
 - Involve patient in the process.

Revision of Treatment Plan May Include:

- More frequent visits
- Buprenorphine dose adjustment
- Shortened prescriptions
- Loss of refills
- Team engagement with counselor
- Increased counseling: Relapse prevention groups, individual therapy, IOP.
- Clinical team meeting with patient
- Psychiatric evaluation
- Residential treatment
- Involvement of social services
- Increased provider collaboration
- Family/support involvement

Transferring to Higher Level of Care

Communication is key: provider to program

- Warm hand-off whenever possible
- Confirm last prescription – consider bridge script
- Support through the transfer process
- Discuss if patient may return for re-evaluation at future date

The Next Stage of Buprenorphine Care for Opioid Use Disorder

Stephen A. Martin, MD, EdM; Lisa M. Chiodo, PhD; Jordon D. Bosse, MS, RN; and Amanda Wilson, MD

Table. Buprenorphine Care: Previous Approaches Compared With New Findings and Recommendations

Previous Approach	New Findings and Recommendations
A medical setting is needed for induction. Benzodiazepine and buprenorphine coprescription is toxic.	Home induction is also safe and effective (6). Buprenorphine should not be withheld from patients taking benzodiazepines (5).
Relapse indicates that the patient is unfit for buprenorphine-based treatment. Counseling or participation in a 12-step program is mandatory.	Relapse indicates the need for additional support and resources rather than cessation of buprenorphine treatment (43). Behavioral treatments and support are provided as desired by the patient (6).
Drug testing is a tool to discharge patients from buprenorphine treatment or compel more intensive settings. Use of other substances is a sign of treatment failure and grounds for dismissal from buprenorphine treatment.	Drug testing is a tool to better support recovery and address relapse (56). Buprenorphine treatment does not directly affect other substance use, and such use should be addressed in this context (43).
Buprenorphine is a short-term treatment, prescribed with tapered dosages or for weeks to months.	Buprenorphine is prescribed as long as it continues to benefit the patient (6).

Buprenorphine Outcomes & Retention

Buprenorphine promotes retention, and those who remain in treatment become more likely over time to abstain from other opioids.

About The Doorway

You are not alone. For many people in New Hampshire, opioid and substance use addiction is a daily reality. The New Hampshire Department of Health and Human Services is here to help. Through the Doorway NH, you will be connected to support, guidance, and community, and access treatment, recovery, and self-sufficiency services. Whether you are seeking help for yourself or a loved one, or are simply looking for information on resources related to substance misuse, you've come to the right place. The Doorway NH will direct you to the help you need, from screening and evaluation, to treatment including medication-assisted treatment, to long-term recovery supports. The Doorway NH will also help guide you on the path to self-sufficiency, offering connections to job training and education resources and assistance with food, childcare and transportation.

You are never alone. And never far from help.

Toolkit for Treating Opioid Use Disorder in D-H Primary Care

We are in the midst of an epidemic of opioid misuse and overdose deaths. Despite the extent of the problem, >80% of people with an opioid use disorder (OUD) do not receive treatment due to limited capacity, stigma, financial obstacles and other barriers. With support of a multidisciplinary team, primary care clinicians can treat less complex patients with OUD in an integrated approach that also addresses commonly co-occurring mental and physical health issues—helping close the treatment gap. The following resources have been curated to facilitate implementation and support clinicians in effectively addressing this treatable chronic disease.
